

Welcome to our Ground post Estate gate
installation guide

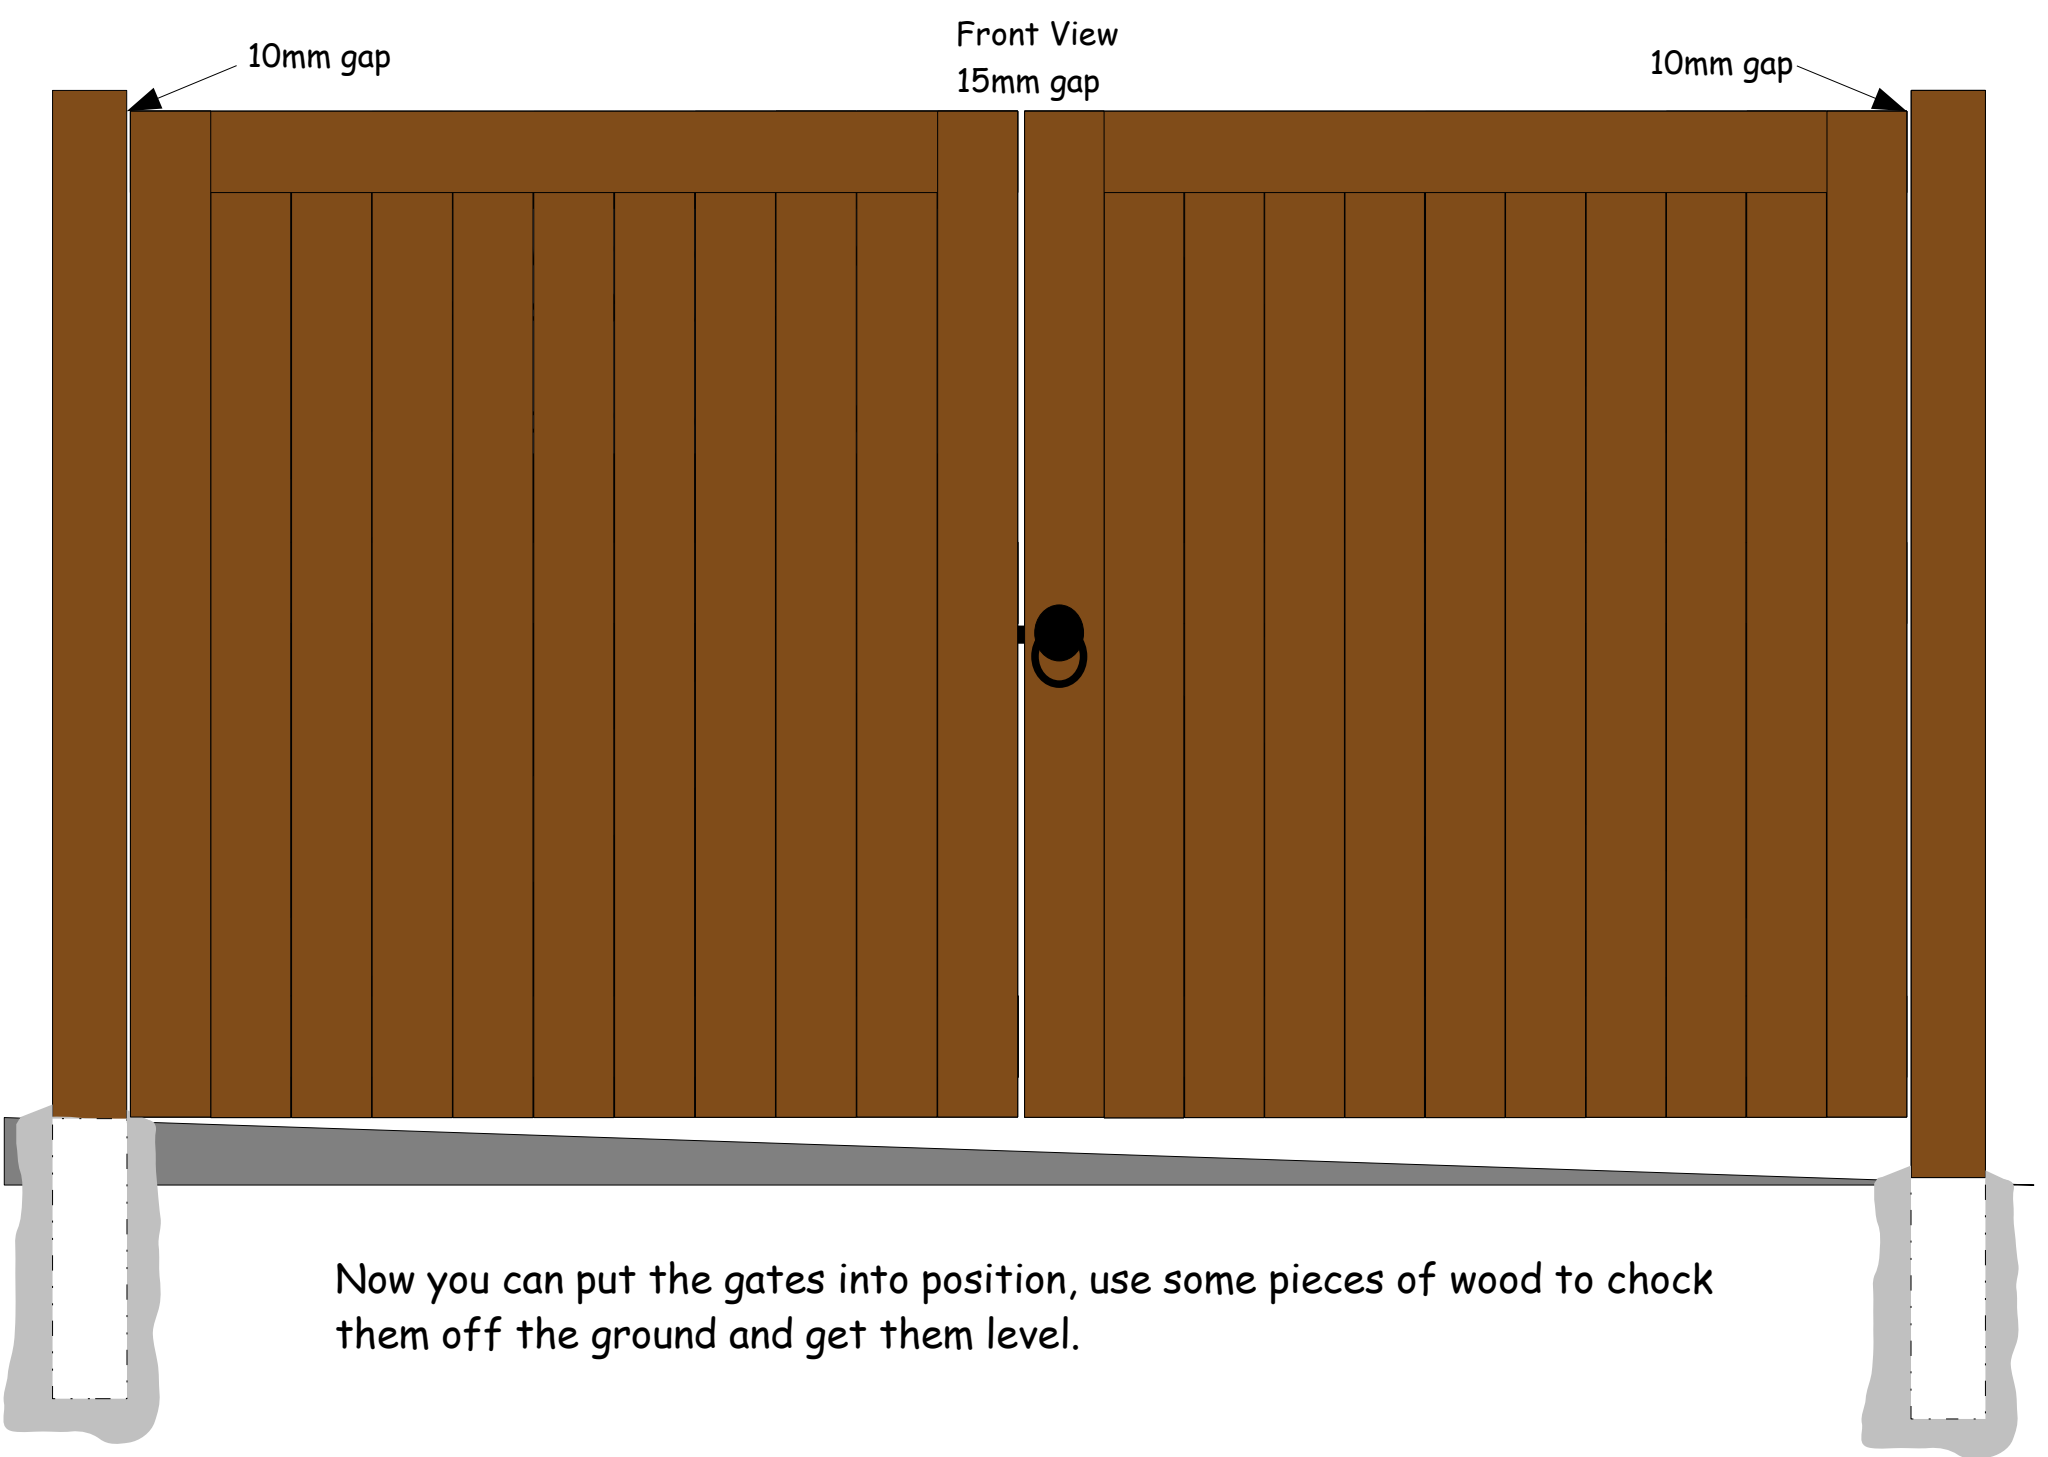

Level

- To start with you need to cement the posts into the ground with the tops of the posts level.
- If you are fitting our standard 1780mm high gates, your post (on the highest ground) would usually be approx 1840mm from ground to top.
- The width between the posts is the size of the gates plus an extra 30-35mm for breather gaps
(ie. On a 2400mm overall pair you would fit the posts 2430-2435mm apart)

Slightly angle the cement around the post to allow water to run away

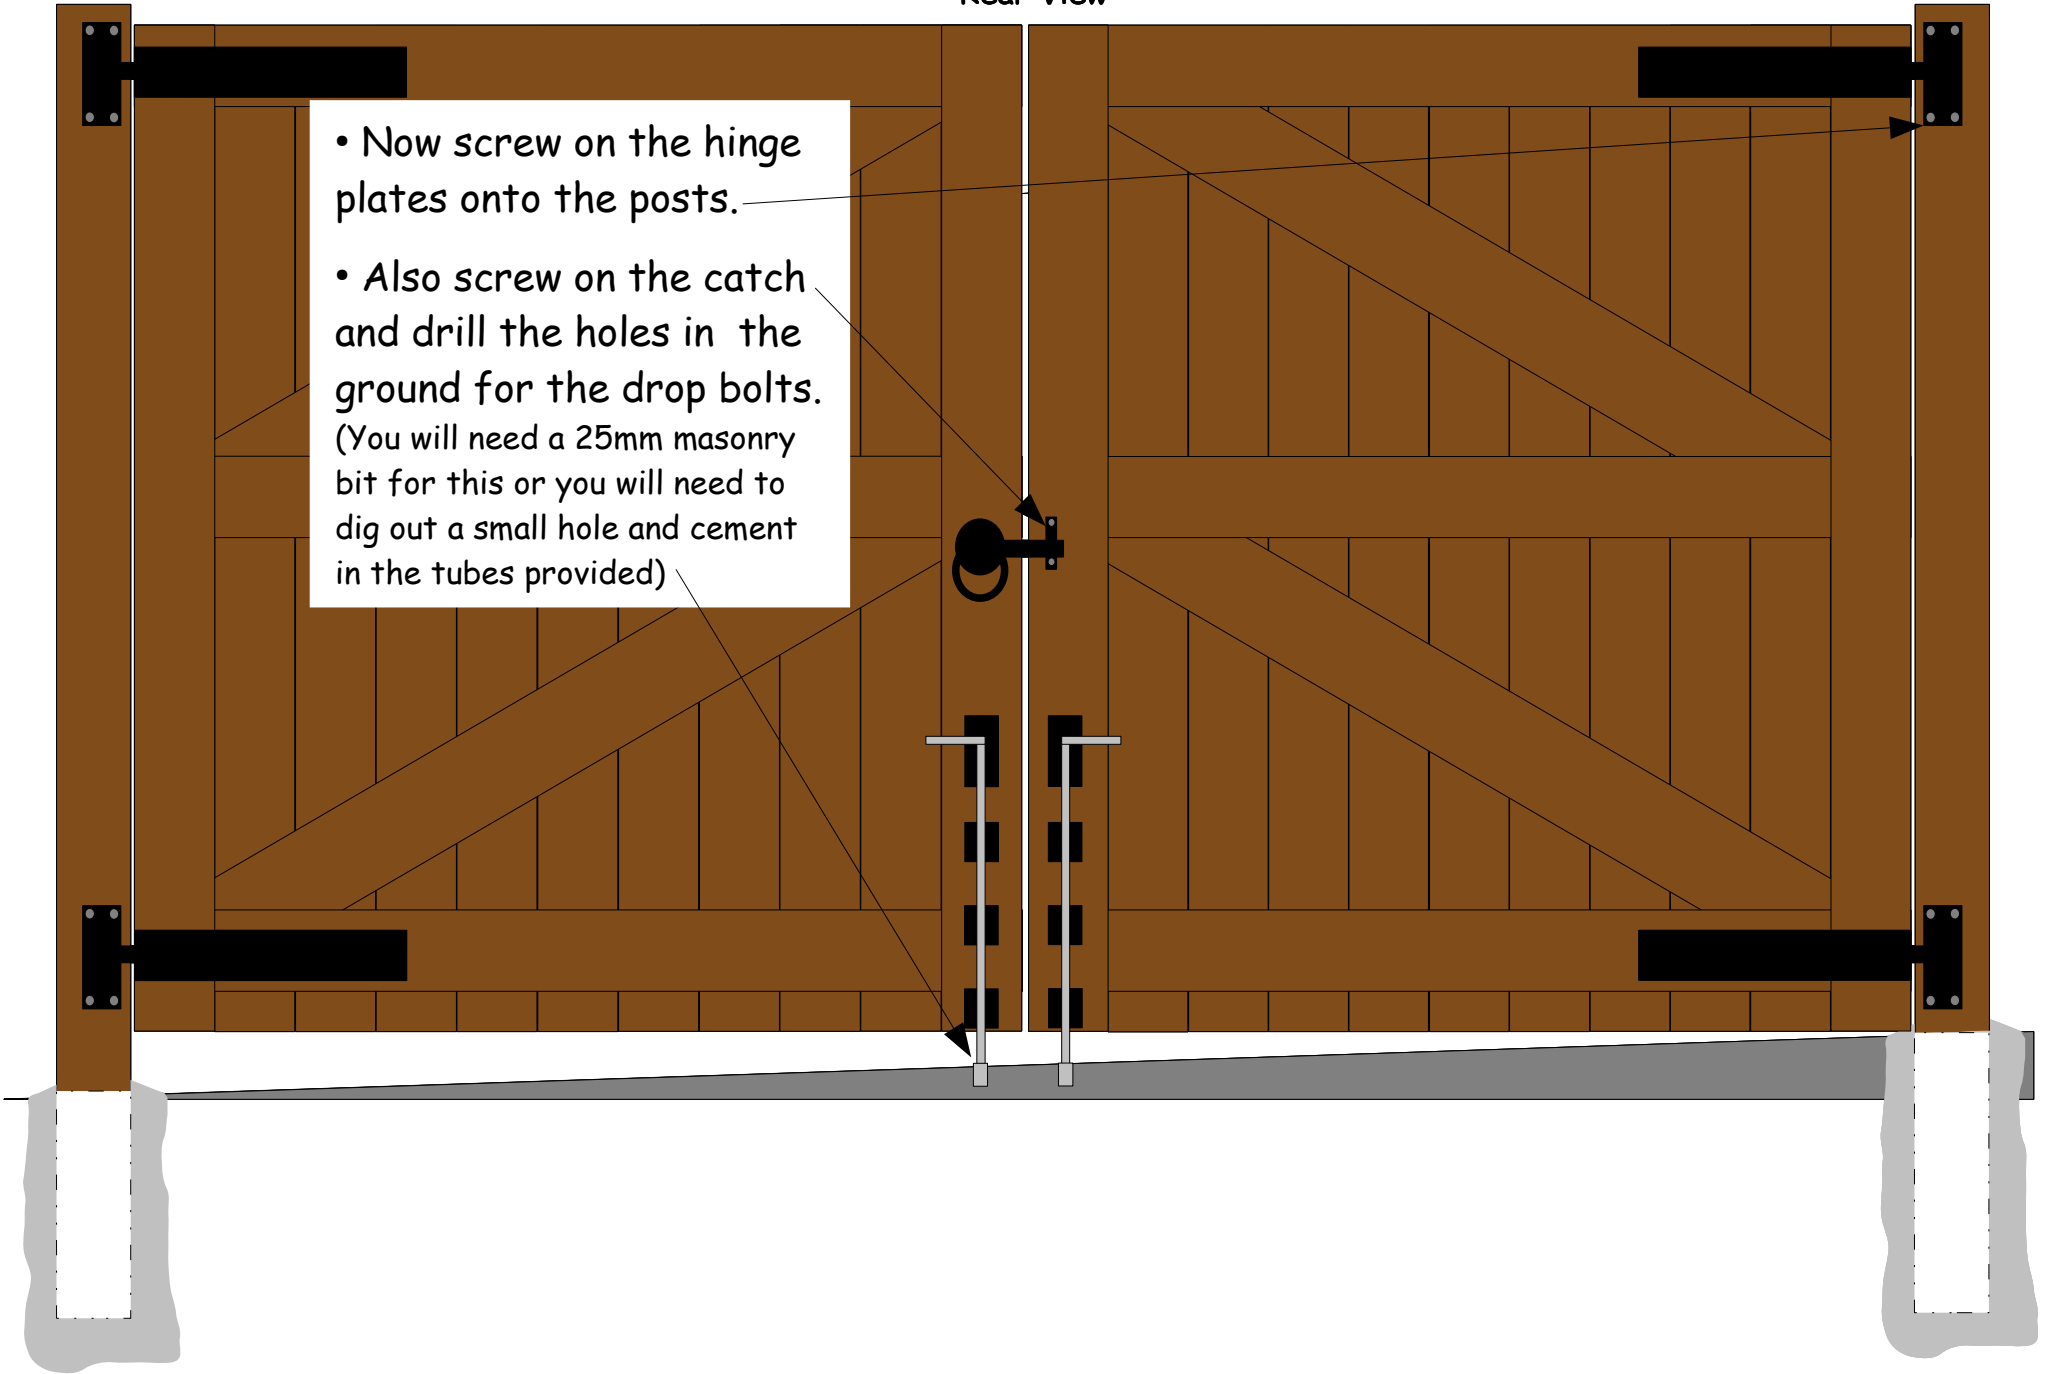

Allow 75 mm minimum cement around the post

Rear View

- Now screw on the hinge plates onto the posts.
- Also screw on the catch and drill the holes in the ground for the drop bolts. (You will need a 25mm masonry bit for this or you will need to dig out a small hole and cement in the tubes provided)

Congratulations
You have finished the job
